

Project Name: CoreCRM

Prepared For: Internal Use – Software House Team

Date: June 19, 2025

1. Project Summary

CoreCRM is a custom-built Customer Relationship Management system designed to centralize and streamline client interactions, lead tracking, and sales processes within our software house. The platform will empower the sales and account management teams to efficiently manage opportunities, track communication history, and build lasting client relationships using a tailored and lightweight system.

2. Project Goals

- Centralize lead and client data in one place
 - Track communication history and opportunity stages
 - Enable easy follow-ups and activity reminders
 - Support collaboration between sales, marketing, and delivery teams
 - Generate actionable reports on lead performance and client lifecycle
-

3. Key Features

A. Lead Management

- Manual and form-based lead entry
- Lead source tracking (website, referrals, events)
- Lead tagging (industry, product interest, status)

- Status stages: New → Contacted → Qualified → Converted → Lost

B. Contact & Company Profiles

- Central database of individuals and organizations
- Notes, contact history, files, social/media links
- Relationship mapping (e.g., multiple leads under same org)

C. Pipeline Tracking

- Visual deal pipelines (Kanban-style)
- Custom stages per team/product
- Expected value, win probability, timeline

D. Tasks & Reminders

- Assign tasks to team members
- Due dates and priority levels
- Email and in-app reminders

E. Team Collaboration

- Role-based permissions (Sales, Admin, Viewer)
- Internal comments on leads/deals
- Activity logs for transparency

F. Analytics & Reports

- Monthly lead conversion summary

- Top sources and industries
 - Sales velocity and deal health
-

Technical Stack

- **Backend & Frontend:** Ruby on Rails (monolith with Hotwire or API + React if preferred)
- **Database:** PostgreSQL (built-in support with Rails)
- **Authentication:** Devise (role-based auth), Pundit for authorization
- **Email Integration:** ActionMailer with Postmark or SendGrid
- **Background Jobs:** Sidekiq or DelayedJob (for reminders, async emails)
- **Hosting:** Render, Heroku, Fly.io, or self-hosted with Docker
